

STORAGE

Once again we are fast approaching the winter storage time. Last year I talked about the proper way to store your bike, I talked about phase separation in the fuel and how to prevent it. It appears this may become more of a problem in the near future as the EPA has given the green light to increase the percentage of ethanol in gasoline to 15%.

The more alcohol the more likely that this condition could happen. Whatever you add to your fuel tank makes sure it will stabilize the fuel and prevent phase separation.

Maintain your battery with a tender and make sure your bike has fresh oil before putting it up. Cover it with a breathable cover and make sure the surface is clean.

Thank,

Tim Allen
